PTM: Activation requires a sequential transfer of a phosphate group from a His in the primary transmitter domain, to a Asp in the receiver domain and to a His in the secondary transmitter
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           environmental signals.

"Genome sequence of Halbacterium species NRC-I.",
Proc. Natl. Acad. Sci. U.S.A. 97:12176-12181 (2000).
-!- FUNCTION: POSSESSES TWO ACTIVITIES: A DNA SYNTHESIS (POLYMERASE)
AND AN EXCONCLEDINITY THAT DEGRADES SINGLE STRANDED DNA
IN THE 3' TO 5' DIRECTION. HAS A TEMPLATE-PRIMER PREFERENCE WHICH
IS CHARACTERISITIC OF A REPLICATIVE DNA POLYMERASE (BY SIMILMAITY).
-!- CALLALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 HSP-NRC1 POLC INTEIN (POTENTIAL).
DNA POLYMERASE II LARGE SUBUNIT, 2ND PART
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  PTM: THIS PROTEIN UNDERGOES A PROTEIN SELF SPLICING THAT INVOLVES A POST-TRANSLATIONAL EXCISION OF THE INTERVENING REGION (INTEIN) FOLLOWED BY PEPTIDE LIGATION (POTENTIAL). SIMILARITY: BELONGS TO THE ARCHAEAL DNA POLYMERASE II FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        PROSITE; PS50818; INTEIN C TER; FALSE NEG.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Pred. No. is the number of results predicted by chance to h
score greater than or equal to the score of the result bein
and is derived by analysis of the total score distribution.

                                Fibronectin protei
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vascular cell adhesion molecule-1 (VCAM-1) is protein found on the surface of endothelial cells that line the interior wall of capillaries. VCAM-1 recognises and binds to the integrin alpha-4beta-1 (IAHB1, or VLA-4 for very late antigen-4), a heterodimeric protein present on the surface of certain white blood cells. Binding of IAHB1 to VCAM-1 allows white blood cells to adhere to the capillary wall in areas where the tissue surrounding the capillary has been infected or damaged. Sometimes this white blood cell migration can become uncontrolled, with white blood cells flooding to the scene, causing widespread tissue damage. Cpds. capable of blocking this process may be beneficial as therapeutic
                                                                                         Human fibronectin

agents. IA4B1 also recognises the extracellular matrix glycoprotein fibronectin. Three distinct IA4B1-binding sites have been identified within fibronectin. One site is found in the HeplI region and is expressed in all isoforms; two others (CS1 and CS5) are present in the alternatively spliced type III connecting segments. CS1 has the higher affinity for IA4B1 and contains the tripeptide LDV as its minimal active site. Peptides AAR95704-805 are modeled after a portion of the CS1 peptide that include the LDV domain presented in such a way by its novel flanking sequence to produce a potent inhibitor of IA4B1 binding.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 AAW25187-W25192 are peptides containing an LDV sequence or equivalent. The peptides are capable of binding to cell adhesion molecules and are used in aqueous irrigation solutions for use during and after endoscopic operations. Preferred irrigation solutions are electrolyte-free and contain in microgyml to 100 mg/ml of one or more oligopeptides containing the amino acid sequences: RGD, LDV, IDA, DGEA, GPRP, VTL, YIGSR, KQAGDV and/or REDV (given in one letter amino acid code). The solutions are especially used for irrigating the bladder during and after tumour removal by transurethral resection. The peptides protect against recurrence of tumours.
                                                                                                                                                                                                                                           Gaps
